

Before and after pictures of sweet Petunia. She came in to our facility covered in fleas but with her thick black fur we did not notice until she was already in foster care. Her foster mom was able to provide her with medications/Advantage II to clear up the fleas and the little bit of eye infection she had. She is now 1 years old and living a very spoiled and happy life.

These 2 kittens came to the shelter with horrible upper respiratory infections and covered in fleas from being born and growing up outside. Mom had been trapped, spayed and released back into the community but we were going to try to socialize her 2 surviving babies. With medications for the infections and Advantage for the fleas they were able to make a full recovery and become some of the sweetest girls that foster has ever had.
